Accumulator piston seal installation

Overview

Are Seal kits available for all piston accumulator models?

Seal Kits are available for all piston accumulator models. When ordering seal kits, please supply the complete model and serial numbers from the name plate and specify fluid type and operating temperature. Parker offers a wide variety of mounting, charging and gauging accessories.

What is a piston accumulator?

Piston type accumulators are designed with compact, rugged steel shell and caps. The steel shell allows heat to dissipate effectively. The bore is micro-finished for extended seal life. The threaded caps allow for easy repair and seal replacement. The piston seal consists of a unique, patented five-bladed V-O-ring with back-up washers.

Why do accumulators have piston seals?

The piston seal design helps to prevent sudden failure of the accumulator. The V-O-ring seals are available in a wide variety of compounds to cover a broad range of fluids and operating temperature ranges (see Options).

How do you remove a piston accumulator?

Clamp the piston accumulator to a work bench and remove the gas valve, adapters, and all accessories. Unscrew the end caps on the gas and fluid side using apropriate spanner wrench or threaded rods positioned opposite each other. On large end caps, an extension rod can be used.

Which position should a HYDAC piston accumulator be installed in?

MOUNTING POSITION HYDAC piston accumulators operate in any position. Vertical installation is preferable with the gas side uppermost, to prevent contamination from the fluid settling on the piston seals. Accumulators with electrical limit switch monitoring must be mounted vertically. 1.5.

How do you install a piston seal?

Remove all seal and guide rings, clean the piston thoroughly and inspect for defects. 2. Place the piston seal into a bath of water and begin to heat. This will allow the seal to expand for easier installment. 3. Heat the submerged seal to a temperature of about 200*F for 15 minutes.
