From the raw materials to battery-grade commodities used in EV batteries and electronics, as well as black mass and rare earths, we price the critical materials that are helping to build a more sustainable future. This includes benchmark prices for lithium and cobalt, two battery materials that.

For example, the price of cobalt has fallen from roughly \$70,000 per metric ton in 2022 to about \$30,000 in 2024. Similarly, the price for lithium carbonate has fallen from a high of approximately \$70,000 per metric ton to well below \$15,000 in 2024. This article focuses primarily on two of the.

The latest data based on EV registrations in over 110 countries show the sales weighted average monthly dollar value of the lithium, nickel, cobalt, manganese and graphite contained in the batteries of the average EV based on global end-user registrations, battery capacity and chemistries. Put it.

NMC refers to NMC111 with equal shares of nickel, manganese, and cobalt. In order to assess the impact of raw material price changes on product prices, it is important to understand the raw material composition of electricity storage technologies. Figure 2 illustrates this for lithium-ion battery.

The raw material bill for the contained lithium, graphite, nickel, cobalt and manganese in the batteries of EV sold during the first four months of year climbed to over \$4 billion, even as prices for lithium hydroxide and carbonate continue to set new lows. Chinese LCE prices averaged below \$10,000. How much does nmc111 battery cost?

NMC111 with equal shares of nickel, manganese and cobalt assumed here. Battery pack price of 130 USD/kWh assumed. Values in brackets show baseline raw material cost assumptions based on monthly average prices from 2010-2020.

How much does cobalt cost in 2022?

For example, the price of cobalt has fallen from roughly \$70,000 per metric ton in 2022 to about \$30,000 in 2024. Similarly, the price for lithium carbonate has fallen from a high of approximately \$70,000 per metric ton to well below \$15,000 in 2024.

Why are nickel-metal hydride batteries expensive?

Nickel-metal hydride batteries exhibit relatively high raw material cost due to large amounts of nickel. These batteries are also subject to commodity price fluctuations of nickel, leading to pack cost of 250 USD/kWh in the worst case.

What is the difference between LFP and NMC battery pack prices?

LFP battery pack prices are most sensitive to copper, aluminium and lithium hydroxide cost. A quadrupling of all three would increase pack prices by ~35%. In contrast, NMC battery pack prices are most sensitive to the cathode materials, nickel and cobalt. A quadrupling of the cost for both would increase NMC battery pack prices by more than 50%.

Why did NCM battery cell prices drop in May?

Asian nickel cobalt manganese (NCM) battery cell prices fell to their lowest level for the first time in over three years in May, retreating significantly from the peak seen in 2022. A combination of lower critical battery raw material prices, supply glut, a sluggish demand and improving technology has kept a tight lid on NCM [].

Would a quadrupling of copper prices increase LFP & NMC pack prices?

A quadrupling of copper prices, i.e. 300% cost increase, would increase LFP or

NMC pack prices by 16.2% or 15.1% respectively. LFP battery pack prices are most sensitive to copper, aluminium and lithium hydroxide cost. A quadrupling of all three would increase pack prices by ~35%.
