The cost of an electric vehicle (EV) battery pack can vary depending on composition and chemistry. In this graphic, we use data from Benchmark Minerals Intelligence to showcase the different costs of battery cells on popular electric vehicles.

Lithium nickel cobalt aluminum oxide (NCA) battery cells have an average price of \$120.3 per kilowatt-hour (kWh), while lithium nickel cobalt manganese oxide (NCM) has a slightly lower price point at \$112.7 per kWh. Both contain significant nickel proportions, increasing the battery's energy.

The per kWh price of NCM811 cell is currently the lowest in Greater China due to the low cost of battery materials, thanks to high localization, and the price difference in the manufacturing cost of these cells compared to Europe and North America. However, S&P Global Mobility forecasts a more than.

The latest data based on EV registrations in over 110 countries show the sales weighted average monthly dollar value of the lithium, nickel, cobalt, manganese and graphite contained in the batteries of the average EV based on global end-user registrations, battery capacity and chemistries. Put it.

The raw material bill for the contained lithium, graphite, nickel, cobalt and manganese in the batteries of EV sold during the first four months of year climbed to over \$4 billion, even as prices for lithium hydroxide and carbonate continue to set new lows. Chinese LCE prices averaged below \$10,000.

As natural and synthetic graphite, lithium carbonate and hydroxide, and nickel, cobalt and manganese sulphate prices decline further, the raw materials bill for the average EV is now down to \$510 compared to \$918 in October 2023 and a monthly peak of more than \$1,900 at the beginning of last year.
